

WebQuest: Beta-What?

A look at carbohydrates and our immune system

Background

Carbohydrates are one of the biological molecules necessary for human survival and yet much is still unknown regarding human processing, storage, and use of these amazing chemicals. Your task today will be to learn more about a specific type of carbohydrate, beta-glucans, and their effect on the immune system.

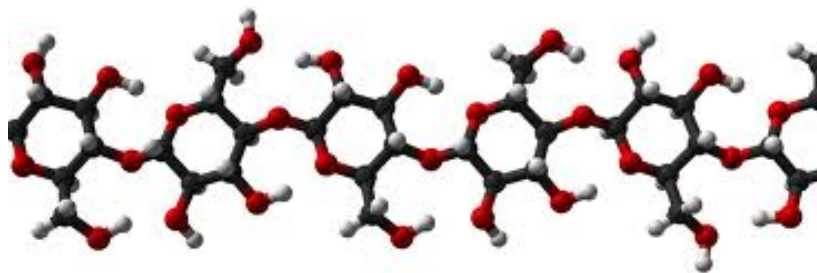

Information will be presented to you discussing the choices of some people to use diet as the sole method of combating cancer, instead of using traditional medical treatments such as radiation, chemotherapy, and surgery. You will take all this information into consideration and create an infographic outlining why diet should (or should not) replace conventional medicine as a cancer therapy.

All the details about this project, resources for your search and interesting videos await you on this WebQuest!
